Cyber Threats and Vulnerabilities 2 Project Submission

These are the expectations for the final project for this course

Posted Thu Oct 8, 2026 at 6:27 pm

Criteria	Grading Scale	
Advanced Threat Analysis The project must demonstrate advanced APT campaign analysis including malware reverse engineering with detailed technical documentation. Complex attack patterns must be analyzed with demonstrated zero-day research methodology and findings. A comprehensive supply chain vulnerability assessment must be completed with clear documentation of methods and results. All analysis must include detailed methodology documentation, technical findings, indicators of compromise, and mitigation recommendations. Evidence must include reverse engineering outputs, attack pattern analysis, and vulnerability assessment results.	**1** Complete	**0** Incomplete
Enterprise Vulnerability Management The project must implement a complete enterprise vulnerability management program with documented processes and procedures. Advanced asset discovery must be performed with detailed relationship mapping and impact analysis. An automated security testing framework must be developed and implemented with evidence of functionality. Custom security assessment tools must be created and deployed with proper documentation. Advanced security control assessment must be performed with comprehensive reporting of findings. All implementations must include performance metrics and validation evidence.	**1** Complete	**0** Incomplete
Advanced Threat Intelligence Operations The project must demonstrate successful deployment of an enterprise threat intelligence platform with evidence of proper configuration and operation. Campaign tracking and analysis systems must be implemented with demonstrated effectiveness. Advanced indicator management processes must be developed and documented with clear workflows. Detailed threat actor profiles must be created with attribution analysis and supporting evidence. Intelligence fusion operations must be configured with demonstrated integration capabilities and operational metrics.	**1** Complete	**0** Incomplete
Risk Management & Audit Implementation The project must include a comprehensive enterprise risk assessment with detailed quantification methodology. A security audit program must be developed with clear procedures and guidelines. Compliance frameworks must be implemented with evidence of proper controls and monitoring. Advanced control validation must be performed with detailed testing documentation. Audit reports must be created following professional standards with clear findings and recommendations.	**1** Complete	**0** Incomplete
Platform Development & Integration The project must demonstrate successful Docker environment configuration and platform installation with proper documentation. Feed integration and management must be implemented with evidence of proper data flow. Platform configurations must be customized to meet security requirements with documented settings. Analytics dashboards must be developed with appropriate metrics and visualizations. Complete platform deployment documentation must be provided including architecture diagrams, configuration settings, and operational procedures.	**1** Complete	**0** Incomplete
