Administrator Dashboard & Incident Assistance

STAGE 1 | EMPLOYEE INCIDENT ASSISTANCE

MILESTONE PURPOSE

Week 8 expands DeRexi's administrative oversight milestone to include employee incident reporting and policy-guided incident assistance. This report documents the completed Stage 1 implementation; administrator incident triage remains Stage 2.

DELIVERED IN STAGE 1

- An additional "Report an incident" tab beside the existing policy Q&A experience.
- Incident category picker sourced from the existing /incident-categories API, with description validation and default severity.
- Submission path wired to POST /incidents; successful responses display an incident reference, status, and severity.
- Policy-grounded guidance after submission, with an "Open policy" action when a supporting policy matches the incident description.
- "Your reports" list that requests incidents filtered by reporter_id and shows category, status, severity, description, date, and handler if assigned.
- Backend checks for unknown reporters and incident categories, returning 404 rather than relying on database errors.

PRESERVED FUNCTIONALITY

Existing policy questions and answers, feedback buttons, clarification routing, and the Governance Dashboard were retained. OpenCode reported no Week 7 messaging implementation, database migrations, or Week 9 authentication changes in this stage.

Verification & evidence

TEST RECORD | OCTOBER 11, 2026

AUTOMATED CHECKS

OpenCode reported 9 of 9 isolated tests passing using synthetic data, FakeSession, and a TestClient dependency override. No incident records were written to live Supabase during testing.

- Policy guidance returns no match below its confidence threshold and a policy reference when a match is sufficiently confident.
- Incident submission rejects an unknown reporter or category with HTTP 404; valid mocked submission returns HTTP 201.
- Category default severity is applied and valid explicit severity can override the default.
- Reporter-scoped GET /incidents returns the expected records in isolated tests; incident categories endpoint returns categories.
- Python compilation and JavaScript syntax checks passed.

READ-ONLY LIVE CHECKS

OpenCode confirmed /health returned status "ok" and database "reachable"; six incident categories were present. It observed two seeded incidents overall and one result for reporter_id=8. These were read-only checks, not proof of secure per-user access.

FILES AND CHECKPOINT

- backend/main.py — API filtering, validation, and incident guidance helper
- backend/static/app.js — report flow, confirmation, and report list
- backend/static/style.css — incident report and list presentation
- backend/tests/test_week8_stage1.py — new isolated tests

GitHub checkpoint: commit 452e019 ("Implement Week 8 employee incident assistance"), reported pushed and verified on origin/main. No Supabase migrations, schema changes, or live incident writes were reported.

What remains

STAGE 2 + WEEK 9 DEPENDENCIES

WEEK 8 STAGE 2: ADMINISTRATOR INCIDENT OVERSIGHT

- Connect Assign, Escalate, and Resolve buttons to real PATCH /incidents/{id} operations; currently the buttons are presentation-only.
- Add an incident detail view including description, category, severity, status, assignment, and resolution notes where recorded.
- Add incident status and severity filtering, plus oversight metrics, without replacing the existing policy-health dashboard.
- Verify employee and handler journeys in the browser; use approved synthetic records or mocks rather than unapproved live writes.

WEEK 9: SECURITY AND USER AUTHENTICATION

Current persona selection is a demonstration control, not verified user authentication. The reporter_id filter is not an authorization boundary: the application still needs server-verified identity and per-request permissions before private incident data or messaging can be safely exposed to real users.

COMPLETION STATEMENT

Stage 1 is implemented and passed the reported isolated test suite. The full Week 8 milestone is not yet complete because administrator oversight actions and end-to-end browser validation remain. Internal messaging and authentication are separate planned work, not delivered features of this checkpoint.

NEXT DEVELOPMENT CHECKPOINT

Review Stage 2 scope; implement incident triage controls using mocked tests; verify the full employee-to-administrator workflow before marking Week 8 complete.
