Criteria	Grading Scale	
Set Up a Secure Development Environment The project must include documentation demonstrating the successful installation and configuration of VS Code with required security extensions, including SonarLint and GitGuardian. It must also provide evidence of proper Git security configuration, including .gitignore setup, and the configuration of basic security features in a web framework. Screenshots or supporting documentation must be included to verify the correct setup of security tools.	1 Complete	0 Incomplete
Implement Secure Coding Practices The project must include input validation for at least 2 different types of user input, proper output encoding for displayed data, and secure error handling that does not expose sensitive information. Additionally, the project must demonstrate basic authentication with password security requirements. Code examples for each security measure must be documented, with explanations of their implementation.	1 Complete	0 Incomplete
Perform Code Analysis and Security Testing The project must demonstrate the use of a static analysis security tool and include documentation of findings. A code review must be conducted using a security checklist, and the project must include at least 3 security test cases, covering positive, negative, and edge cases. The test results must be documented, including identified security issues, evidence of tool usage, and test execution logs.	1 Complete	0 Incomplete
Conduct a Basic Vulnerability Assessment The project must include an assessment identifying at least 2 common web vulnerabilities based on OWASP Top 10. The assessment must involve basic web security testing on a provided or self-created application. A vulnerability report must be submitted, including clear descriptions, steps to reproduce, and recommendations for remediation. Screenshots or logs must be provided as evidence of identified vulnerabilities.	1 Complete	0 Incomplete
Apply Security Best Practices in Development The project must demonstrate the implementation of secure coding standards in submitted code examples. It must also include applied input validation, sanitization, and data protection methods, along with secure configuration settings to prevent misconfigurations. Documentation must explain the purpose and application of each security measure implemented.	1 Complete	0 Incomplete
Produce Security Documentation and Reporting The project must include comprehensive security issue reports, documentation of test cases and test results, and a detailed vulnerability assessment report. Proper documentation templates must be followed, and all reports must include evidence such as screenshots, logs, and structured explanations to support findings.	1 Complete	0 Incomplete
